USE OF FUZZY ANALYSIS TO STUDY THE PARENT STUDENT INTER-RELATIONSHIP IN CASE OF ENGINEERING STUDENTS

W.B. Vasantha Kandasamy and A. Praveen Prakash

In this paper we analyze the parent-student inter-relationship model with specific reference to engineering students. We felt this study was essential mainly because several parents have spent many lakhs of rupees on their children for the sake of an engineering degree but the students say that even after the completion of their degree they are unemployed or under-employed working in call centers or internet cafes, in jobs that has no relevance or connection to their earlier education. Thus the investment of the parents on their children has turned out to be a loss, more so in the case of female students where their parents begin to ill-treat them considering them as a burden. Thus at this juncture it has become a need of the hour to analyze this inter-relationship and draw conclusions based on our study using fuzzy analysis.
