The increase in school dropouts is very steady, many reasons can be attributed for it. The major reasons for school dropouts in the poverty that the family faces and no proper motivation of the school students by the teachers. Further no necessary action is taken by the government to stop or even lessen the school dropouts.

Now we view the school dropouts and its relation to migration. For we see majority of the school dropouts (also school goers who drop from school and go to work) in Mudianur village near Kallakurichi, Villupuram district migrate to Kerala for labour. They labour in summer and come back to their village in the rainy season because they do not have any work in the rainy season. These school dropouts who are in the age group from 10 to 15 are vulnerable to several bad habits which will directly affect their health. After migration they find it difficult to adjust with their
society and family for they lose respect when they work in different states. Since the data is full of uncertainties we are justified to adopt fuzzy theory. Also, in this study the role of teacher, government and family is involved and we cannot interrelate them. Hence we are justified in using Linked Fuzzy Relational Maps (Linked FRMs) to analyze the problem.
